**[57] Abstract:**

To determine an antibody by incubation with three different receptors  $R_1$ ,  $R_2$  and  $R_3$ , of which  $R_1$  and  $R_3$  are present in the liquid phase and capable of binding to the antibody,  $R_2$  is present bound to a solid phase and is capable of binding to  $R_1$  and  $R_3$  carries a label, separation of the solid from the liquid phase and measurement of the labelling in the solid phase, a conjugate of a substance specifically recognised by the antibody to be determined and a reaction component of a specific binding system is used as  $R_1$ , a conjugate of a substance specifically recognised by the antibody to be determined and a label is used as  $R_3$  and the other binding component of the specific binding system is used as  $R_2$ .
